

Maximise your security posture with Ideal's Microsoft Security Workshop

Securing remote workers and endpoints across hybrid cloud, SaaS and on-premise environments is one of the top challenges coming into the year. Microsoft invests massively in securing their environments to minimise risk for customers, but businesses still bear responsibility for securing their applications and data. Understanding how to leverage the Microsoft portfolio can be daunting as there are a dizzying number of products and services available. That's where Ideal can help.

Ideal has worked with several organisations to help them optimise their specific options within the Microsoft portfolio, spanning users, applications and data, endpoints, and infrastructure through our **Microsoft Security Workshop**.

Proper configuration and governance of your modern workplace is essential to keeping it secure and available for your remote working strategy to be successful. Security is one of the core benefits of utilising cloud technologies, but it also presents challenges in terms of complexity and visibility.

Microsoft offers a huge suite of products and services to help secure your environment, but it can be challenging to know what to choose and how best to implement them.

Below are the core considerations for a robust modern working security strategy.

Modern enterprises need to account for multiple types of users: guests, employees, partners, and contractors.

Remote workers may not always use the enterprise network to access applications.

A Zero Trust Networking security strategy can help organisations adapt to new environments and modern ways of working,

Multifactor Authentication (MFA) and Conditional Access become vital components to securing applications and data.

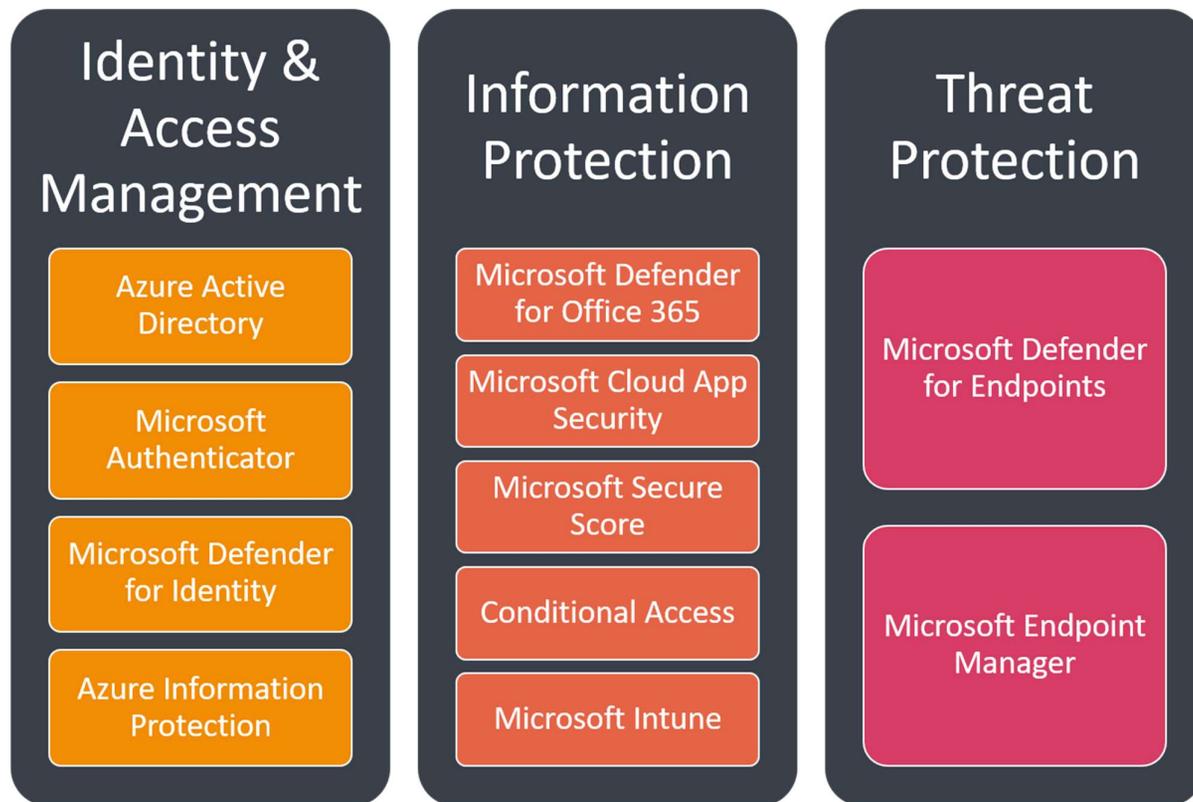

Remote workers now expect their experience to be consistent across all locations and devices.

Microsoft
Partner

Gold Cloud Platform
Silver Datacenter
Silver Cloud Productivity
Silver Small and Midmarket Cloud Solutions
Silver Application Development

Below is an example of the key areas we look at and the Microsoft products that are available. We will simplify the portfolio and give best practice recommendations for your security strategy.

Ideal's Microsoft Security Workshop will help you identify areas of concern, technologies that can help and will create a roadmap for the future so that you can keep pace with security trends. Our workshops are run by our Microsoft Solution Architect, Matt Notcutt, who has years of experience helping organisations realise the full potential of their Microsoft investment.

Example agenda

High level review of your security concerns and challenges

Overview of current technology trends and security best practices

Generation of ideas on how key security problems can be solved

Development of your security strategy and technology roadmap

'Art of the possible' showcasing Microsoft's suite of security solutions

To book a workshop with Matt, contact your Account Director on 01273 957 500
